

Assignment 6

Make the Website Responsive

Anna's Kitchen Website Project

Project scenario

The Anna's Kitchen website is complete on desktop, but the two-column content and wide menu table must also work effectively on smaller screens. The client has requested a responsive implementation that adapts without losing content or functionality.

Your task

Refactor the layout using a mobile-first approach. The default CSS should suit narrow screens, and a min-width media query should restore the two-column layout when enough space is available.

1. Add a responsive table wrapper

- In index.html, wrap the menu table in a generic div element.
- Give the wrapper the class table-wrapper.
- Keep the table and its content unchanged.
- Set .table-wrapper to overflow-x: auto so the table can scroll horizontally if necessary.

2. Establish the narrow-screen layout

- Make the single-column Grid layout the default for .content-grid.
- Keep a 20px gap between the stacked sections.
- Ensure the menu and booking sections occupy the available width.
- Allow the navigation items to wrap rather than overflow the viewport.
- Keep images and video flexible using max-width: 100% and height: auto.
- Ensure form controls remain within their section.

3. Add the tablet and desktop breakpoint

- Create a media query using min-width: 768px.
- Inside the media query, change .content-grid to two columns using 2fr 1fr.
- Retain the existing 20px Grid gap.
- Create another media query using max-width: 470px.
- Inside the media query, change the nav bar to columns

4. Test responsive behaviour

- Test at a narrow phone width of approximately 320px to 480px.
- Test at a tablet width around the 48rem breakpoint.
- Test at a desktop width of at least 1100px.
- Verify that text remains readable without page-level horizontal scrolling.
- Verify that the menu table can be reached using horizontal scrolling when required.
- Verify that every form control remains usable at each width.
- Verify that navigation links remain visible and selectable.
- Verify that the positioned figure caption remains attached to the image.

Important implementation guidance

- Responsive design should adapt the same HTML content rather than maintaining separate mobile and desktop pages.
- Use content-driven breakpoints and test the actual page rather than relying only on device presets.
- Avoid hiding essential content to make the layout fit.
- Avoid fixed page widths that force the browser viewport to scroll horizontally.
- Do not remove keyboard focus styles or form validation during the responsive refactor.

Expected result

On narrow screens, the menu and booking form should stack vertically and the table should remain accessible within a horizontal scrolling wrapper. At 48rem and above, the 2fr 1fr desktop Grid should return. All navigation, media, form controls and captions should remain usable across the tested widths.

Assessment criteria

- ☐ The default .content-grid layout contains one column.
- ☐ A min-width: media query creates the 2fr 1fr layout.
- ☐ The menu table is inside .table-wrapper with horizontal overflow enabled.
- ☐ The page does not introduce page-level horizontal scrolling at narrow widths.
- ☐ Navigation links remain available and do not overflow the viewport.
- ☐ Images and video resize without distortion.
- ☐ The booking form remains usable at phone, tablet and desktop widths.
- ☐ The figure caption remains correctly positioned over the image.
- ☐ The page retains the semantic structure, content and visual design from previous assignments.
- ☐ The completed project has been tested in a browser at multiple viewport widths.
